

C Programming for Python Users

Dr Frederick Fung

National Computational Infrastructure, Australia

Acknowledgement of Country

The National Computational Infrastructure acknowledges, celebrates and pays our respects to the Ngunnawal and Ngambri people of the Canberra region and to all First Nations Australians on whose traditional lands we meet and work, and whose cultures are among the oldest continuing cultures in human history.

Day 1 & Day 2

- ① 1330 - 1415
- ② break
- ③ 1420 - 1500

This training will deliver on Gadi, the supercomputer hosted by NCI.

Documentation available at

- 1 `https://github.com/NCI900-Training-Organisation/
intro-to-c-programming.git`
- 2 **change to branch mar-2026**

Code available at

- 1 `gitclone--branchmar-2026https:
//github.com/NCI900-Training-Organisation/
intro-to-c-programming.git`

This training will cover the following:

- 1 Types, Operators, and Expressions
- 2 Branching and Iteration
- 3 Functions
- 4 Scopes
- 5 Memory locations
- 6 Pointers
- 7 Arrays and Strings
- 8 Dynamic Memory
- 9 Structures
- 10 GDB

his workshop isn't about convincing you to switch from Python to C. Instead, it builds on your existing Python 3 knowledge to introduce C, with the aim of helping you combine the strengths of both languages and write efficient, scalable applications in HPC environments.

- 1 It is a Compiled Language
- 2 Rich and direct scientific library support
- 3 First class citizen in parallelisation support

Again, C is not as a replacement for Python, but as a powerful engine you can leverage alongside your Python workflows.
